

A CASE STUDY — MEMBER MENU

Nathan Dana

Trusted Design Leader

FOUR THINGS ABOUT ME

- 01 I use what I design
- 02 I ask the challenging questions
- 03 I build relationships
- 04 Make it configurable

01

I use what I design

“Nathan combined strategic vision with hands-on leadership.”

HANNAH

Transform, and my role

I started Transform as its only designer and grew it into a team of eleven — designers, developers and product — and led it the whole way, as UX Architect and Design Systems Lead.

Care management

Utilization

Member dashboard

Outreach

Next application

Transform Components, patterns, and the behaviour rules underneath every application

TruCare Cloud

An enterprise care platform: several applications, hundreds of screens, and a workforce that lives in it all day.

20,000

employees in the application
every working day.

Fortune 25

Centene's scale.

20 Million

Americans' care decisions
pass through it.

A dropdown that behaves differently on two screens is an annoyance in most products. Here it is a hesitation in the middle of an authorization.

Member Menu started because I was using the system I was responsible for designing.

02

I ask the challenging questions

“He is one of the most professional, knowledgeable, and cross-skill thinkers I've ever come across in his craft. He is genuinely passionate about looking at systems holistically.”

JORDAN

The team, and the ask

THE BRIEF

Add a menu that lets users navigate without going back to the member dashboard.

Four designers

Working across the applications the menu had to serve.

Senior product leadership

In the room because the problem crossed application boundaries.

Technical leadership

Architecture and implementation constraints, from the start.

Individual application teams

Input and buy-in gathered team by team, not mandated.

MY ROLE

Brought in as a design system consultant — and quickly became the lead on the final solution, the visual design and the prototyping.

Dana

CARE MANAGER

RESPONSIBILITIES

Sixty members, worked across assessments, outreach and the care plan.

GOAL

Finish a member without losing the thread of the last one.

NEEDS IN VIEW

The active member, unsaved work, and the last ten members she touched.

“I know where everything is. I just do not want to go and get it.”

Marcus

UTILIZATION REVIEWER

RESPONSIBILITIES

A queue of authorizations, entered from a different application several times a day.

GOAL

Get to a decision without rebuilding context each time.

NEEDS IN VIEW

The right entry point for this authorization, and nothing else.

“I arrive with a case, not a member.”

Priya

SUPERVISOR

RESPONSIBILITIES

Oversees a team; samples work across people and cases rather than completing it.

GOAL

See state quickly and hand the work back.

NEEDS IN VIEW

Where the work stands, and a way back to where she was.

“I am never in one place for long.”

The understanding evolved because we asked the questions, over and over.

03

I build relationships

“Nathan brought a thoughtful leadership style, deep design expertise, and a genuine passion for helping others. He was always approachable, collaborative, and patient.”

SUZANNE

Within the design team, leadership, development

Where the context breaks

STEP 1

Starts an authorization

AUTHORIZATION INTAKE

Starts John Smith's authorization

She begins entering the information needed to authorize John's care.

MOOD

Focused and confident

Where the context breaks

AUTHORIZATION INTAKE

Stops to find missing information

She realizes she needs more information about John's allergies. Before leaving, she must manually save the authorization and remember where she stopped.

MOOD

Interrupted and cautious

Where the context breaks

MEMBER SEARCH

Searches for the same member again

The system no longer carries John's context, so she searches for him and confirms that she has found the correct member.

MOOD

Annoyed

Where the context breaks

MEMBER DASHBOARD

Rebuilds John's context

She opens John's dashboard and begins looking for the information she needs.

MOOD

Searching and uncertain

Where the context breaks

ALLERGIES

Digs into the allergy details

She locates and expands the allergy card, opens the details page, and searches for the specific information needed for the authorization.

MOOD

Frustrated, but making progress

Where the context breaks

WORK PAGE

Leaves John's record behind

With the allergy information found, she navigates back to her work page — but the system does not return her to the authorization.

MOOD

Disoriented

Where the context breaks

WORK PAGE

Reconstructs her original task

She finds John again, opens his authorizations, and looks for the one she paused.

MOOD

*Frustrated and
mentally taxed*

Where the context breaks

AUTHORIZATION INTAKE

Tries to pick up where she left off

She opens the paused authorization, reorients herself, and enters the allergy information.

MOOD

Relieved, but cautious

The team made progress as we built trust with leadership, with our SMEs. We listened.

[VIDEO – INITIAL SOLUTION WALKTHROUGH]

04

Make it configurable

“Nathan has a remarkable talent for translating conceptual design needs into scalable, architecturally sound solutions. I've seen firsthand his unique ability to bridge the gap between complex design strategy and technical execution.”

CHRISTINE

Why it wasn't viable

Every application carried its own code base, and none of them could be overhauled inside the timeline.

So the menu had to work without rewriting anything underneath it.

04 — MAKE IT CONFIGURABLE

The final Member Menu

The member stays fixed.
Paused work is held.
Everything about the
member is one click
from wherever the user
is standing.

Context stays with the member

STEP 1

Starts an authorization

AUTHORIZATION INTAKE

Starts John Smith's authorization

She begins entering the information needed to authorize John's care.

MOOD

Focused and confident

Context stays with the member

MEMBER MENU

Moves to related member information

When she realizes she needs allergy information, she opens the Member Menu and selects Allergies. Her authorization is automatically saved and added to the menu as paused work.

MOOD

Reassured

Context stays with the member

ALLERGIES

Finds the information she needs

She reviews John's allergy details while the system continues to preserve both the member and authorization context.

MOOD

Confident and productive

Context stays with the member

MEMBER MENU

Returns directly to her work

She opens the Member Menu, selects the paused authorization, and enters the allergy information exactly where she left off.

MOOD

Focused and in control

The original journey forces the user to remember the context.

The revised journey makes the system remember it.

ORIGINAL

Eight steps

REVISED

Four steps

The solution had to be flexible and configurable so we avoid solving this problem again and again.

01

I use what I design

I design for the real world.

Because I used Transform every day, I found the problem
the library could not see.

01

02

I ask the challenging questions

I understand complex problems.

The brief said menu. The questions found a member-journey problem.

03

I build relationships

I create alignment and trust.

Nine parties had to hold one definition of the problem before anything could be designed.

04

Make it configurable

I deliver solutions that
scale.

One model, resolved by role, permission and application
— the next product is a setting, not a project.
